Analysis Of Algorithms Solutions

Welcome to my page of solutions to "Introduction to Algorithms" by Cormen, Leiserson, Rivest, and Stein. It was typeset using the LaTeX language, with most diagrams done using Tikz. It is nearly complete (and over 500 pages total!), there were a few problems that proved some combination of more difficult and less interesting on the initial ...

Analysis of Algorithms - Final (Solutions)

The term "analysis of algorithms" was coined by Donald Knuth. Algorithm analysis is an important part of computational complexity theory, which provides theoretical estimation for the required resources of an algorithm to solve a specific computational problem.

Solution: We assume that there are at least 2 elements in the array; otherwise, the problem is ill-defined. Further, we assume that the number of elements in A is an exact power of 2, in order to simplify the exposition. Algorithm 1.2 represents a Divide-And-Conquer approach for computing both the minimum and maximum elements of the input array.

Algorithm 1 LINEAR-SEARCH(A;v) Input: A = ha1;a2;;;ani and a value v. Output: An index i such that v = A[i] or nil if v 62A for i 1 to n do if A[i] = v then return i end if end for return nil As a loop invariant we say that none of the elements at index A[1;;;i - 1] are equal to v. Clearly, all properties are fulfilled by this loop invariant. 2:2-1

Express the maximum number of operations, the algorithm performs in terms of n. Eliminate all excluding the highest order terms. Remove all the constant factors. Some of the useful properties on Big-O notation analysis are as follow: If f (n) = c.g (n), then O (f (n)) = O (g (n)) ; where c is a nonzero constant.
