Types of control. There are three types of control viz., Feedback Control: This process involves collecting information about a finished task, assessing that information and improvising the same type of tasks in the future. Concurrent control: It is also called real-time control. It checks any problem and examines it to take action before any loss is incurred.

Planar mechanisms. While all mechanisms in a mechanical system are three-dimensional, they can be analyzed using plane geometry, if the movement of the individual components are constrained so all point trajectories are parallel or in a series connection to a plane.In this case the system is called a planar mechanism.The kinematic analysis of planar mechanisms uses the subset of Special ...

A control system may be operated by electricity, by mechanical means, by fluid pressure (liquid or gas), or by a combination of means. When a computer is involved in the control circuit, it is usually more convenient to operate all of the control systems electrically, although intermixtures are fairly common. Development of control systems.

Short-term regulation of blood pressure is controlled by the autonomic nervous system. Changes in blood pressure are detected by baroreceptors. These are located in the arch of the aorta and the carotid sinus. Increased arterial pressure stretches the wall of the blood vessel, triggering the baroreceptors.

Body temperature control in humans is one of the most familiar examples of homeostasis. Normal body temperature hovers around 37 °C (98.6 °F), but a number of factors can affect this value, including exposure to the elements, hormones, metabolic rate, and disease, leading to excessively high or low body temperatures.The hypothalamus in the brain regulates body temperature, and feedback about ...
