Fundamentals Of Electromagnetic Fields Physics

Charge comes in 2 types, positive and negative and is measured in Coulombs (C). If you have a charge on its own it emits a field in all directions. The field from a charge is represented by E as in E-lectricity. If you put another charge in the field it experiences a force. Like charges repel and unlike charges attract.

The existence of electromagnetic waves depends on the interaction between electric and magnetic fields. Maxwell postulated that a time-varying electric field produces a magnetic field. His theory predicted the existence of electromagnetic waves in which each time-varying field produces the other field.

At the subatomic level, electromagnetism is related to the electromagnetic force that causes the attraction and repulsion of electrically charged particles. It is considered one of the fundamental forces in nature, that also includes gravitational and nuclear forces. (See Fundamental Forces for more information.)

The wave equation follows, along with the wave speed equal to that of light (3×10^8), suggesting (correctly) that light is an electromagnetic wave. The vector relationship between the electric field, the magnetic field and the direction of wave propagation is described. Your browser does not support the video tag.

It is a standard exercise in relativistic electrodynamics to show that the electromagnetic field tensor $F_{\mu\nu}$, whose components equal the electric $E_i = cF_{i0}$ and magnetic $B_i = -\frac{1}{2}\epsilon_{ijk}F_{jk}$ fields in the taken frame of reference, has two Lorentz invariant quantities, $\frac{1}{2}F_{\mu\nu}F_{\mu\nu} = B^2 - E^2$ and $\frac{1}{4}F_{\mu\nu}\star F_{\mu\nu} = \frac{1}{4}\epsilon_{\mu\nu\alpha\beta}F_{\mu\nu}F_{\alpha\beta} = \mathbf{B} \cdot \mathbf{E}$.
